

Observation B: implementation sanity check and first-order degeneracy

31 MoE layers; 32 frozen calibration samples

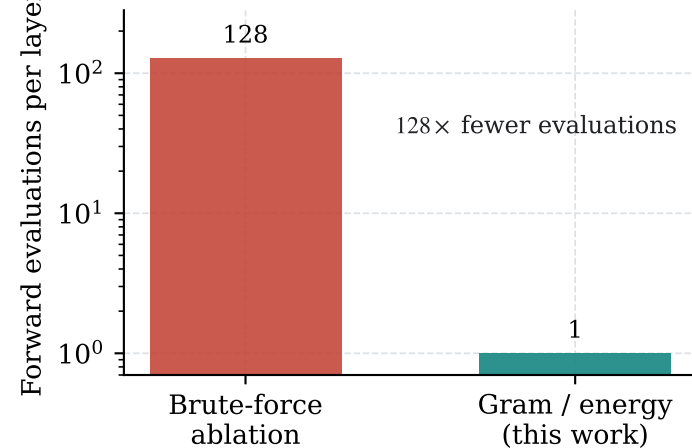

(a) Sanity check: HVP vs. Gram energy

(b) Sanity check: HVP vs. single removal

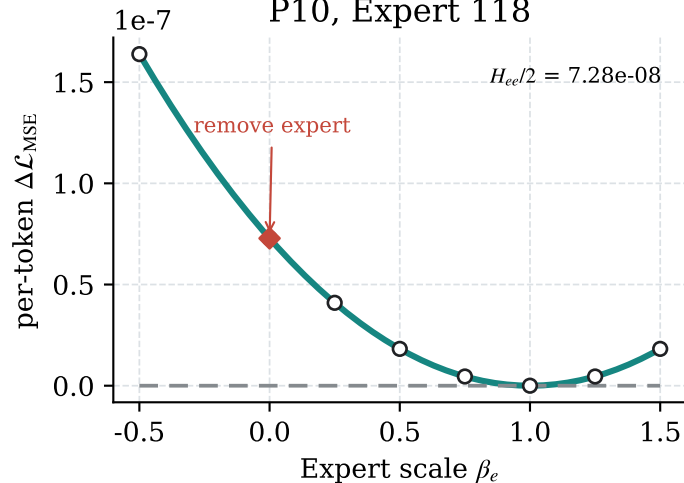

(c) Cost of the same exact score

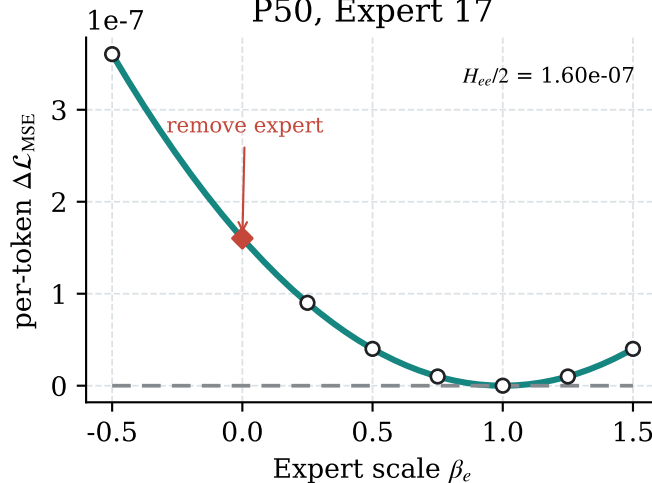

Ranking vs. true removal: first order Spearman = undefined (all $g_e=0$); second order Spearman = 1.000000.

— diagonal Hessian prediction --- first order: $g_e(\beta_e - 1) = 0$ ○ measured forward ◆ single removal ($\beta_e = 0$)

(d) Low sensitivity
P10, Expert 118

(e) Medium sensitivity
P50, Expert 17

(f) High sensitivity
P90, Expert 105
